DECIMALS, FRACTIONS AND PERCENTAGES

Fractions: Is an expression that indicates the quotient of two quantities. **Ex. $\frac{p}{q}$;** $\frac{1}{2}$; $\frac{1}{3}$; $\frac{42}{2.1}$; $\frac{445.61}{2.64}$; $\frac{785}{2}$; $\frac{36}{3}$; - $\frac{40}{20}$; - $\frac{1}{9}$ etc. Upper part is Numerator (N) and Lower part is Denominator. The Denominator can not be zero.

Division: Write the first set as it is; replace ÷ (division sign) by × (multiplication sign); Exchange Numerator and Denominator of second set; Perform Multiplication.

$$\frac{N1}{D1} \div \frac{N2}{D2} = \frac{N1}{D1} \times \frac{D2}{N2}$$

$$\frac{84}{44} \div \frac{42}{66} = \frac{84}{44} \times \frac{66}{42} = \frac{21 \times 4}{22 \times 2} \times \frac{22 \times 3}{21 \times 2} = \frac{4}{2} \times \frac{3}{2} = 3$$

Reciprocals

Ending in 9:

Ex. 1: $\frac{1}{19}$?

A: Denominator is 19. Positive Osculator of 19 is 2. (Go through "Divisibility" Unit to understand osculator concept).

$$\frac{1}{19} \approx \frac{1}{20} = \frac{0.1}{2}$$

Now for $\frac{0.1}{2}$

Divisor	2	2	2	2	2	2	2	2	2	2	2	2	2
Dividend	0.1	1	10	-	5	12	6	3	11	15	17	18	9
Quotient	-	**0.**	**0**	**5**	**2**	**6**	**3**	**1**	**5**	**7**	**8**	**9**	**4**
Remainder	-	-	-	0	1	0	0	1	1	1	1	0	1

Divisor is 2 in all cases. Initial Dividend is 0.1. We can not divide 0.1 by 2 so in quotient we need to give decimal point. New Dividend is 1. Again we can not divide 1 by 2 so in quotient we need to add zero. New Dividend is 10. We divide 10 by 2. Q is 5 and R is 0. New Dividend is RQ (05). Remainder and then append Quotient. 5÷2; Q=2; R=1; Next Dividend=12 (∵R=1 & Q=2). Like this we go on dividing. Final answer: Quotient Row.

$$\frac{1}{19} = \mathbf{0.052631578}....$$

POLYNOMIALS

Multiplication using Criss Cross Method
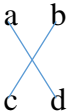

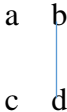

Note: Read Multiplication using Criss Cross or Vertically & Crosswise Method from Multiplication Unit
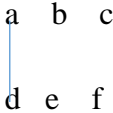

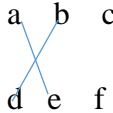

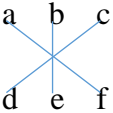

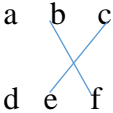

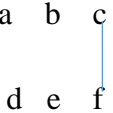

Steps:
1. Write coefficients of given polynomials one below the other separated by space or vertical bar.
2. Multiply coefficients using formula (refer formula OR graphical representation).
3. Last part is constant. Go on incrementing powers of variable by 1 from right. Second last is x, then x^2, x^3, x^4, x^5 and so on.
   Note: Write coefficient as zero if any term is absent.

Solution using "If the Set is same, it is ZERO"

4.

A. If N1+N2=D1+D2 then

N1+N2=D1+D2=0

$$\dfrac{3x+5}{5x+4} = \dfrac{4x+6}{2x+7}$$

3x+5+4x+6=**7x+11**

5x+4+2x+7=**7x+11**

∴ 7x+11=0

x = **-** $\dfrac{11}{7}$

B. If $\mathbf{m}$(N1+N2)=$\mathbf{n}$(D1+D2) then

N1+N2=D1+D2=0 ($\mathbf{m,n}$=common factors)

$$\frac{7x + 2}{2x + 1} = \frac{5x + 6}{x + 1}$$

7x+2+5x+6=**12x+8=4(3x+2)**

2x+1+x+1=**3x+2=1(3x+2)**

$\therefore$ 3x+2=0

x $= -\frac{2}{3}$

C. If $\mathbf{m}$(N1-D1)=$\mathbf{n}$(N2-D2) then

N1-D1=N2-D2=0 ($\mathbf{m,n}$=common factors)

$$\frac{3x + 5}{5x + 4} = \frac{4x + 6}{2x + 7}$$

3x+5-5x-4= -2x+1 and 4x+6-2x-7= 2x-1 = -1 (-2x+1)

$\therefore$ -2x+1=0; 2x=1; x $= \frac{1}{2}$

Solution using Calculus

This sutra tells that: Differentiation of expression is equal to square root of discriminant.

E=> $ax^2+bx+c = 0$ ----(Expression)
D(E) = 2ax+b   ----(Differentiation of Expression)
Discriminant = b^2-4ac
Square Root of Discriminant = $\sqrt{b^2 - 4ac}$

INTRODUCTION TO VEDIC MATHEMATICS

Sutras: Meaning and Usage

Sutra 3: Ūrdhva – tiryagbhyām (ऊर्ध्वतिर्यग्भ्याम्)

Meaning: Vertically and Crosswise.

Usage: This is used to to multiply given numbers vertically and crosswise.

$$ab$$
$$\times \quad cd$$

$$= (a{\times}c) \mid (a{\times}d + b{\times}c) \mid (b{\times}d)$$

$$abc$$
$$\times \quad def$$

$$= (a{\times}d) \mid (a{\times}e + b{\times}d) \mid (a{\times}f + b{\times}e + c{\times}d) \mid (b{\times}f + c{\times}e) \mid (c{\times}f)$$

Ex: 25×67

First Part:	Second Part:	Third Part:
a b 2 5 c d 6 7	a b 2 5 c d 6 7	a b 2 5 c d 6 7
(a×c) **(2×6=12)**	**(a×d + b×c)** **(2×7+5×6=44)**	**(b×d)** **(5×7=35)**

12|44|35
12|44+3|5
12|47|5
12+4|7|5
16|7|5
1675

Applications: to find Product of given numbers and polynomials.
Refer Units: Multiplication and Polynomials.

Sutra 5: Sūnyam Samyasamuccaye (शून्यं साम्यसमुच्चये)

Meaning: If the Samuccay (समुच्चय or समूह or Set) is same, it is ZERO.

Usage:

CASE 3: If the numerical numerators of two fractions are same, then the sum of denominators is ZERO.

Ex. $\dfrac{3}{4x+5} + \dfrac{3}{7x-3} = 0$
Here 3=3; so 4x+5+7x-3=0;
11x+2=0; 11x=-2; x=-2/11.

Ex. $\dfrac{-7}{x^2+6} + \dfrac{-7}{6x+3} = 0$
Here -7=-7; so x^2+6+6x+3=0;
x^2+6x+9=0; $(x+3)^2$=0; x= -3.

Ex. $\dfrac{16}{3x+5} - \dfrac{16}{8x-12} = 0$
16=16; so 3x+5-(8x-12)=0; 3x+5-8x+12=0; -5x+17=0; x= 17/5.
Note: Here sign is negative, so we have subtracted (D1-D2)

CASE 4:
A. If N1+N2=D1+D2 then N1+N2=D1+D2=0
$$\dfrac{3x+5}{5x+4} = \dfrac{4x+6}{2x+7}$$

3x+5+4x+6=**7x+11**; 5x+4+2x+7=**7x+11**
∴ 7x+11=0; x = **-$\dfrac{11}{7}$**

B. If **m**(N1+N2)=**n**(D1+D2) then N1+N2=D1+D2=0
(**m,n**=common factors)

$$\frac{7x + 2}{2x + 1} = \frac{5x + 6}{x + 1}$$

7x+2+5x+6=**12x+8=4(3x+2)**

2x+1+x+1=**3x+2=1(3x+2)**

∴ 3x+2=0

$x = -\frac{2}{3}$

C: If **m**(N1-D1)=**n**(N2-D2) then N1-D1=N2-D2=0 (**m,n**=common factors)

$$\frac{3x + 5}{5x + 4} = \frac{4x + 6}{2x + 7}$$

3x+5-5x-4= -2x+1 and 4x+6-2x-7= 2x-1 = -1 (-2x+1)

∴ -2x+1=0; 2x=1; $x = \frac{1}{2}$

Sutra 13: Sopantyadvayamantyam (सोपान्त्यद्वयमन्त्च्यम्)

Meaning: The ultimate and twice the penultimate

Usage:

$$\frac{1}{AB} + \frac{1}{AC} = \frac{1}{AD} + \frac{1}{BC}$$

If A, B, C and D are in Arithmetic Progression then D+2C=0

$$Ex. \frac{1}{(x + 3)(x + 4)} + \frac{1}{(x + 3)(x + 5)} = \frac{1}{(x + 3)(x + 6)} + \frac{1}{(x + 4)(x + 5)}$$

A=(x+3);

B=(x+4);

C=(x+5);

D=(x+6);

Here A, B, C & D are in Arithmetic Progression;

So, D+2C=0;

(x+6)+2(x+5)=0;
x+6+2x+10=0; 3x+16=0; **x=-16/3.**

Sub Sutras: Meaning and Usage

Sub Sutra 9: Antyayoreva (अन्त्ययोरेव)

Meaning: Only the Last Terms

Usage: This sutra is used to solve certain equations of the type:

After ignoring Constants; Numerator and the Denominator of one side are in the ratio of Numerator and Denominator of the other side.

$$if\ \frac{m(N1)+c1}{m(D1)+c2} = \frac{N2}{D2}\ where\ N1=N2\ and\ D1=D2\ then\ \frac{N2}{D2} = \frac{c1}{c2}$$

m is common factor; c1 and c2 are constants.

$$Ex.\frac{x^2+x+2}{x^2+2x+5} = \frac{x+1}{x+2}$$

$$=> \frac{x(x+1)+2}{x(x+2)+5} = \frac{x+1}{x+2}\ then\ \frac{x+1}{x+2} = \frac{2}{5}; x = -\frac{1}{3}$$

Sub Sutra 12: Vilokanam (विलोकनं)

Meaning: By Mere Observation

Usage: This sutra is used in solving quadratic and simultaneous equations. Refer Unit: Quadratic Equations.

Ex: $x + \frac{1}{x} = \frac{10}{3}$; By Vilokanam (विलोकनं) we say that x=3.
